# Tiny Array: Handling Smaller

## Data

### What is Tiny Array?

Tiny Array is a python library that provides similar functionality to Numpy but is specifically designed for handling smaller datasets. It is known for its exceptional performance, being 3 to 7 times faster than Numpy when working with smaller data.

### Limitations

However, Tiny Array is not suitable for handling large datasets. It also lacks compatibility with popular data science libraries like Pandas and TensorFlow. Despite these limitations, it remains an excellent option for small-scale data operations.

### Example Usage

```
array([[19, 22],  
       [43, 50]])
```

```
import tinyarray  
as ta  
a = ta.array([[1,  
2], [3, 4]])  
b = ta.array([[5,  
6], [7, 8]])  
c = ta.dot(a, b)  
print(c)
```

# Tiny NumPy: Limited Functionality, Improved Speed

## What is Tiny NumPy?

Tiny NumPy is another alternative to Numpy that offers similar functionalities but with limited functionality compared to the original library. It boasts improved speed compared to Numpy, making it a suitable choice for certain applications.

## Not Suitable for Large Arrays

Similar to Tiny Array, Tiny NumPy is not recommended for handling large arrays or datasets. However, for smaller computations, it can be a viable alternative that provides a significant performance boost.

## Example Usage

```
array([ 1.44, 11.559999999999999, 31.359999999999996])
```

```
from tinynumpy
import tinynumpy
as tnp
a =
tnp.array([1.2,
3.4, 5.6])
b =
tnp.multiply(a, a)
print(b)
```

# SciPy: Integration with Data Science Libraries

## What is SciPy?

SciPy is a powerful python library that builds upon the functionality of Numpy and integrates seamlessly with other data science libraries like Pandas and Matplotlib. It offers a vast array of modules for various mathematical operations and scientific computing tasks.

## Extensive Mathematical Operations

With SciPy, you can perform operations such as linear algebra, optimization, integration, interpolation, special functions, FFT, signal and image processing, and even solve ordinary differential equations. It provides a comprehensive set of tools for scientific computations.

## Example Usage

```
array([[ -2. ,  1. ],  
       [ 1.5, -0.5]])
```

```
import numpy as np  
from scipy import  
linalg  
A = np.array([[1,  
2], [3, 4]])  
inv_A =  
linalg.inv(A)  
print(inv_A)
```

# SymPy: Symbolic Mathematics

## What is SymPy?

SymPy is a sophisticated python library specifically designed for symbolic mathematics. Unlike other libraries that convert equations into numeric arrays, SymPy allows you to work with equations in their symbolic form.

## Symbolic Equation Solving

With SymPy, you can manipulate equations, solve algebraic expressions, perform calculus operations, and simplify complex mathematical expressions, all while retaining the symbolic representation.

## Example Usage

$$x^2 + 2x - 3$$

```
import sympy
x, y = sympy.symbols('x y')
eq = sympy.Eq(x + y, 2)
sol = sympy.solve(eq, x)
print(sol)
```

# PandaPy: Lightweight DataFrame Alternative

## What is PandaPy?

PandaPy is a lightweight alternative to Pandas, the popular data manipulation library. It provides similar functionality, allowing you to work with data frames, but with a smaller memory footprint, making it ideal for datasets up to 50,000 rows.

## Efficient Memory Utilization

Compared to Pandas, PandaPy is more memory efficient, which is particularly beneficial when working with smaller datasets or environments with limited computational resources.

## Example Usage

```
array([[(-122.49, 37.37, 27., 1885., 661., 1357., 986., 8.6635, 344780.),  
       (-118.2, 34.26, 48., 1518., 318., 806., 272., 9.599, 174680.),  
       (-117.82, 33.78, 27., 1589., 507., 1404., 895., 5.7031, 279500.),  
       ...  
       (-119.7, 36.3, 19., 956., 201., 693., 220., 1.2893, 62000.),  
       (-117.12, 36.1, 49., 96., 54., 46., 14., 1.2708, 162500.),  
       (-119.45, 34.42, 42., 1785., 267., 753., 268., 8.1048, 308001.)],  
      dtype=[('longitude', '<f8'), ('latitude', '<f8'), ('housing_median_age', '<f8'), ('total_rooms', '<f8'), ('total_bedrooms', '<f8'), ('population', '<f8'), ('household', '<f8'), ('median_income', '<f8'), ('median_house_value', '<f8')])
```

```
import pandapy as  
pp  
df =  
pp.read("/californ  
ia_housing_test.cs  
v")  
print(df)
```

# DataTables: Handling Large Datasets

## What is DataTables?

DataTables is a python library specifically designed for efficiently handling large datasets. It provides robust features and optimizations that make it suitable for deep learning tasks or analyses that involve working with massive amounts of data.

## High Performance

With DataTables, you can effortlessly handle datasets up to 100 GB in size. It has been optimized to offer exceptional performance, making it an excellent choice for applications that demand efficient processing of large-scale data.
